

Tools of Today and Tomorrow

New technology is changing how buildings are constructed, and the International Code Council (ICC) is at the forefront of streamlining building safety. For example, Building Information Models (BIMs) allow owners to use multi-dimensional digital representations of a structure before breaking ground, and can track essential information over the building's life cycle. Instead of the lengthy, time-consuming, paper-based processes that many building departments currently have in place, the ICC is working with the building construction industry on ways to improve and make "green" the code compliance checking process. ICC eCodes Premium Online Subscription is being integrated into several software packages to provide the user with access to a full library of resources from codes and standards to the ICC-ES® Evaluation Reports®. This allows users to easily find code-compliant products and determine acceptability

of certified products -- all without having to leave the software program. Need to have the codes available on the road? ICC's new Smartphone apps for its codes and support material are now available for the I-Phone, Blackberry, Windows CE, Droid and the newly released iPad. These new apps will provide portable access to eCodes Premium Online Subscriptions, allow for quick viewing of ICC-ES Evaluation Reports, and give "at a touch" access for ordering items from the ICC store and connecting to www.iccsafe.org for news, information and member benefits. Being mobile and "Green" have never been easier for the user. Other products include selected titles on the Kindle, as well as relevant video information on YouTube and Wikipedia. Information at your fingertips has never been faster. With these technologies available, the user saves time, effort and money by having the right information at the right time.

Rome Wasn't Built in A Day, but...

From mountain caves and sod huts to massive modern skyscrapers and energy-efficient homes, human progress is the story of buildings as much as it is the history of tools.

In fact, the great civilizations whose structures remain to this day combined protection from the elements with advances in technology and self-expression. Whether to proclaim national greatness, promote commerce, declare love or honor deities, these buildings gave structural expression to human achievement, innovation and hope. Some took immense forms that have survived through millennia despite earthquakes, wars, storms, erosion, scavenging and theft. Egypt's pyramids, the Greek Parthenon, Roman Colosseum, China's Great Wall and India's Taj Mahal are examples of how human strength and ingenuity crafted sophisticated structures to meet human needs.

DESIGN THROUGH THE AGES

The design of a building—whether it was a breathtaking castle, soaring church, or modest cottage—usually began, until quite recently, with a hand-drawn sketch to put the concept on paper. The designer then developed this idea into elaborate, large-scale drawings with precisely notated features and dimensions. The drafting process was slow and systematic and the more sophisticated the structure, the longer it took. Then construction began with erection of the building itself, taking decades or even centuries. For example, Michelangelo's design for the Vatican Basilica in Rome required almost ten years to develop and the structure, more than 100 years to complete.

These amazing structures, often built for titled nobility, were so well-constructed that they lasted through the centuries. But more importantly for their regal owners, they had to be safe for the intended occupants; otherwise the designer and builder risked dire consequences.

BUILDING SAFETY GOES BACK TO ANCIENT TIMES

In fact, more than 4,000 years ago, the Code of Hammurabi, circa 2200–1800 B.C.E., prescribed the execution of any builder whose faulty construction of a house caused the death of its owner.

Building safety codes since then are far more precise, and the penalties far less drastic. The first building codes in the United States, established in 1625, addressed fire safety and specified materials for roof coverings. In 1630, Boston outlawed wood chimneys and thatch roof coverings. The first known formal U.S. building code was written in 1788 in Old Salem—now Winston-Salem, North Carolina, entirely in German. Larger American cities began instituting building codes in the early 1800s. In 1865, New Orleans became the first city to enact a law requiring inspections of public places.

Adapting Tools and Techniques

Throughout the centuries builders adapted their techniques to their surroundings. For example, New England colonists used poles, stones and string to help them set posts upright and deep into the ground. During the long, frigid winters, frost heaves would forcibly move posts that were not set deeply enough as the ground froze and thawed. Gradually, each town learned to set posts to a depth below the frost

line, the point below which the ground remained unfrozen. Accrued experience guided construction efforts so successfully that a number of those original houses are standing today. Much of that expertise became part of the local building code.

In addition to stones and string, tools such as levels, straight edges, hammers, axes and surveyors' transoms have been around for

centuries. Although electricity has made many tools more powerful and easier to use, their basic purposes remain the same. But innovation continues. Recent technological advances are enabling architects, engineers, city planners, builders, code officials and others in the construction industry to achieve levels of precision and efficiency our ancestors could not have imagined.
